No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Cloned linked to human constant regions in the construction of a humanized cantibody against VLA-4. The 5 and 3 ends of the mouse cDNAs are mammalian cell expression vectors containing human kappa or gamma-1 cc constant regions. In the humanized light chain, amino acids L45, L58 and L69 in the humanized light chain, amino acids L45, CC by the amino acid present in the equivalent position of the mouse cDNAs are constant regions. In the humanized light chain, amino acids L45, CC by the amino acid present in the equivalent position of the mouse containing human kappa or gamma-1 cc L49, L58 and L69 in the human kappa LC vR framework are replaced cc transfected into COS cells. The humanized antibodies can be used cc transfected into COS cells. The humanized antibodies can be used cc to inhibit adhesion of a leukocyte to an endothelial cell and cc can also be used in the treatment of stroke, corebral traumas, cc detecting VLA-4, for affinity purification or for generating cc anti-1diotype antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                     framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 Ig L chain. Plasmids encoding the antibodies can be used to inhibit adhesion of a leukocyte to an multiple sclerosis. They can also be used in the treatment of antibodies can be transaction and to treat inflammatory diseases such as stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used for detecting VLA-4, for affinity nurification or for meneration anti-laid-tune.
                                                                                                                                  The sequence represents the human reshaped antibody 21.6 light chain variable region against leukocyte adhesion molecule VLA-4. Cloned cDNA sequences of mouse 21.6 VL (AAQ99889) and VH (AAQ99892) of a regions are linked to human constant regions in the construction mouse cDNAs are modified using PCR primers (See AAQ99895-98) and mouse cDNAs are modified using PCR primers (See AAQ99895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids L45, L49, L58 and L69 in the human kappa LC VR

The antibody may also be used in the affinity purification of alpha-4 integrin for use as a vaccine or an immunogen. It is also useful for generating idiotypic antibodies. The humanised antibodies of the invention have a half-life in the human circulation essentially

It is composed of complementarity determining regions from the composed in mammalian host cells following pCR amplification and mutagenessis of appropriate mouse and human DNA sequences. The mutagenessis of appropriate mouse and human DNA sequences. The composed composed to produce a claimed humanised 21.6 vH (see AAW22413) can be used to produce a claimed humanised 21.6 antibody that is useful in the manufacture of a medicament for treating asthma, atherosclerosis, and enentia, diabetes, inflammatory bowel disease, theumatoid composed transplant rejection, graft versus host disease, tumour metastasis, nephritis, atopic dermatitis, psoriasis, myocardial composed in the human circulation essentially antibody has a half-life in the human circulation essentially and cover equivalent to that of naturally occurring human antibodies.

Method can be used to produce Abs against interleukin-2 receptor and tumour necrosis factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             04-DEC-1989;

                                                                                                                                                                    variable region (without signal sequence). Cloned cDNA CDR sequences of comouse 21.6 variable light and variable heavy regions are linked to human constant framework regions of the REI antibody for the light chain and the 2*CL antibody for the heavy chain in the construction of a humanized antibody against VLA-4. The 5' and 3' ends of the mouse cDNAs are modified using PCR primers (See AAQ99895-98) and then subcloned into mammalian cell expression vectors containing human kappa or gamma-1 constant regions. In the humanized light chain, amino acids L45, L49, CL58 and L69 in the human kappa LCVR framework are replaced by the amino cacid present in the equivalent position of the mouse 21.6 Ig light coll. Plasmids encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used to inhibit adhesion of a cleukocyte to an endothelial cell and to treat inflammatory diseases such cas multiple sclerosis. They can also be used in the treatment of stroke, cerebral traumas, meningitis or encephalitis. The antibodies can also be used for detecting VLA-4, for affinity purification or for generating

                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes fusion proteins comprising a chemokine and a tumour antigen or HTV antigen. Specifically claimed fusion proteins comprise; (1) human monocyte chemotactic protein 3 (MCP-3) and human Muc-1; (2) human interferon-induced protein 10 (IP-10) and human Muc-1; (3) human macrophage-derived chemokine (MDC) and human Muc-1; (4) human SDF-1 and human Muc-1; (5) human IP-10 and HIV pp120; (6) human MCP-3 and HIV gp120; (7) human MDC and HIV gp120; and (8) human SDF-1 and HIV gp120. The fusion proteins, and nucleotide sequences encoding them, can be used for producing an immune response, e.g. an effector T cell immune response. They can also be used for treating cancer or treating or preventing HIV infection. The fusion proteins and/or nucleotide sequences can be used in in vitro diagnostic assays, as well as in screening assays for identifying unknown tumour antigen epitopes and fine mapping of tumour antigen epitopes. The present sequence represents a fusion protein from the mapping of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes fusion proteins comprising a chemokine at unmour antigen or HIV antigen. Specifically claimed fusion proteins comprise: (1) human monocyte chemotactic protein-3 (MCP-3) and human CC (Muc-1; (2) human interferon-induced protein 10 (IP-10) and human Muc-1; (3) human macrophage-derived chemokine (MDC) and human Muc-1; (4) human SDF-1 and human MCC-1; (5) human IP-10 and HIV 9p120; (6) human MCP-3 and HIV 9p120; (7) human MCC and HIV 9p120; and (8) human SDF-1 and HIV 9p120. The fusion proteins, and nucleotide sequences encoding them, can concerve the sequence of the sequence of the concerve that the sequence of the se
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                           proteins comprise: (1) human monocyte chemotactic protein-3 (MCP-3) and human Muc-1; (2) human interferon-induced protein 10 (IP-10) and human Muc-1; (3) human macrophage-derived chemokine (MDC) and human Muc-1; (3) human Muc-1; (5) human IP-10 and HIV gp120; (6) human MCP-3 and HIV gp120; (7) human MDC and HIV gp120; and (8) human SDF-1 and HIV gp120. The fusion proteins, and nucleotide sequences encoding them, can be used for producing an immune response, e.g. an effector T cell immune response. They can also be used for treating cancer or treating or preventing HIV infection. The fusion proteins and/or nucleotide sequences can be used in in vitro diagnostic assays, as well as in screening assays for identifying unknown tumour antigen epitopes and fine mapping of tumour antigen epitopes. AAY29916 and AAZ21156 to AAZ21168 are sequences given in the SEQ ID LISTING in the present invention but which

She and 328) were producing MADS that were strongly positive egainst glutatione-mercuric ions but negative against glutathione without mercuric ions. RNA was isolated from hybridoma cells with guanidine isothiocyanate. First strand coNA synthesis was catalysed by MALLY reverse transcriptese. The primers used for cDNA synthesis were complementary to the 5' end of the CHI domain of the havy chain expressed by the hybridoma of interest, or to the 5' and of the C kappa domain. Some of the primers used for cDNA synthesis are shown in AAO97511-097518. The primer used for cDNA synthesis of the crainable region of a particular antibody polypeptide was also used for cPR amplification of that variable region, in conjunction with an appropriate V-region primer. In addition, the VH primer AAO97518 was used to amplify the mAD 2D5 and 5B6 heavy chains. The sequences of the PCR amplified nucleotides were determined. These are given in AAO97498-097510 and the deduced AA sequences in AAR97941-R79250 & AAR78970-R78971. The descriptions of the SEQ ID nos given on pp 44-45 and in the claims are different from the descriptions in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

In the humanized light chain, amino acids L45, L49, L58 and L69 in the human kappa LC WR framework are replaced by the amino acid present in the equivalent position of the mouse 21.6 Ig L chain. Plasmads encoding the chimeric antibodies are transfected into COS cells. The humanized antibodies can be used for inhibiting adhesion of a leukocyte to an endothelial cell and for treating inflammatory diseases such as multiple
Alpha-4 integrin; humanised antibody; monoclonal antibody 21.6; asthma; atherosclerosis; AIDS; dementia; diabetes; tumour; metastasis; inflammatory bowel disease; rheumatoid arthritis; transplant rejection; graft versus host disease; nephritis;

It is composed of complementarity determining regions (CDRs) from the VL region (see AAW22409) of mouse alpha 4 integrin monoclonal antibody 21.6 and a modified human REI framework. It can be expressed in mammalian host cells following PCR amplification and mutagenesis of appropriate fragments of mouse and human DNA sequences. The humanised 21.6 VL and a humanised 21.6 VH (see AAW22413) can be used to produce a claimed humanised 21.6 antibody that is useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   metastasis, nephritis, atopic dermatitis, psoriasis, myocardial ischaemia, and acute leukocyte mediated lung injury. The antibody may also be used in the affinity purification of alpha-4 integrin for use as a vaccine or an immunogen. It is also useful for generating idiotypic antibodies. The humanised antibody has a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of the variable region of the kappa light chain from murine monoclonal antibody K20. The antibody recognises the beta 1 subunit (CD29) of integrins and inhibits activation and proliferation of peripheral T cells induced by anti-CD3 antibodies. Monoclonal antibody K20 is a preferred target for humanisation; the humanisation process, the complementarity determining regions (CDRs) of a human antibody with framework regions 70-95% homologous to those of K20 were replaced by the K20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (INRM )

                                                                                                                                                                                                                                          The sequences given in AAR26982-3 contain part of the exotoxin A (ETA) sequence corresponding to positions 252-613 of the full exotoxin A sequence. These sequences are encoded by Fv(FRP5)-ETA fusion genes. The ETA sequence was used as a marker gene so that E. coli transformed with the fusion gene could be identified. The fusion genes were expressed in E. coli and the antibodies were extracted. These recombinant antibodies can be used for the qualitative and quantitative determination of c-erbB-2. This can be used for monitoring or in-vivo localisation of tumours overexpressing c-erbB-2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

A;Title: Both IgM and IgG anti-DNA antibodies are the products of clonally selective B A;Reference number: PH0971; MUID:92381444
A;Accession: PH1064
A;Status: nucleic acid sequence not shown
A;Molecule type: mRNA
A;Residues: 1-97 <TIL>
A;Experimental source: B cell, strain [NZB x NZW]F1
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: immunoglobulin homology <IMM>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ig light chain V region (clone 202.54) - mouse (fragment)
